

ENERGY CONSUMPTION AND EMISSIONS MANAGEMENT COMMITMENT STATEMENT

Our commitment is to progressively reduce usage of diesel and fuel (Scope One energy sources) by adopting new energy-efficient methodologies at all operational sites.

Efficient management of energy consumption contributes to reduced emissions. Where commercially feasible, as a responsible construction company and property developer, we will continue to be a proponent of energy saving designs and features in our projects, including Green technology (“Greentech”), to enable clients to achieve better savings across the lifecycle of their buildings and infrastructure projects.

With regards to electricity consumption (Scope 2 energy), Gabungan is driven to progressively transition to renewable energy sources, in particular solar energy, where commercially feasible. The same will be also proposed to clients for building and infrastructure projects.

Gabungan AQRs Berhad shall continue to explore mechanisms to address its carbon footprint and emissions, primarily through carbon trading mechanisms.
